VALIDATION EVIDENCE

Healthcare Operations Dashboard

Purpose

This document shows how I checked that my Power BI measures are calculating correctly and match the raw data.

1.Measures I Created

I created all KPIs in DAX as measures, not calculated columns:

- Total Encounters = COUNTROWS(encounters)
- Total Claim Cost = SUM(encounters[TOTAL_CLAIM_COST])
- Total Payer Coverage = SUM(encounters[PAYER_COVERAGE])
- Zero Coverage = COUNTROWS(FILTER(encounters, encounters[PAYER_COVERAGE]=0))
- Over 24h Count = COUNTROWS(FILTER(encounters, encounters[Duration_Hours]>24))
- % Over 24h = DIVIDE([Over 24h Count], [Total Encounters])

2. What I Expected vs What I Got

I checked the numbers in Power Query and in Data View first, then compared them to my card visuals:

- Total Encounters — I expected 27,890 rows after removing duplicates. My measure shows 27,890. Pass.
- Total Claim Cost — Expected $101.51M from Excel SUM. My measure shows $101.51M. Pass.
- Total Payer Coverage — Expected $31.10M from SUM. My measure shows $31.10M. Pass.
- Zero Coverage — I filtered PAYER_COVERAGE = 0 in Data View and counted 13,586 rows manually. My measure shows 13,586. I also fixed the format from Decimal (it was showing 13,586K) to Whole Number. Pass.
- Over 24h Count — I filtered Duration_Hours > 24 and got 76 rows. My measure shows 76. Pass.
- % Over 24h — I calculated 76 divided by 27,890 which is 0.002725, which is 0.27%. My measure shows 0.27% with percentage format set to 2 decimals. Pass.

3. How I Validated

First I went to Power Query and confirmed the row count after cleaning was 27,890. Then in Data View I used filters to manually count the zero coverage cases and the over

24h cases to make sure my FILTER formulas were working. I also opened the encounters table in Excel and did a SUM of TOTAL_CLAIM_COST and PAYER_COVERAGE to double-check against Power BI — both matched. I checked that none of my measures returned blank or error values.

4. Screenshots I Attached

I am attaching four screenshots for proof:

Overview page showing all KPI cards -27.89K, 101.51M, 31.10M, 13,586, 0.27%

Formula bar for Zero Coverage showing the FILTER logic

Formula bar for % Over 24h showing the DIVIDE logic

Data View filtered on PAYER_COVERAGE = 0 showing the row count

5. Conclusion

All measures are working correctly and match the source data. Formatting has been corrected, especially for Zero Coverage. There are no discrepancies, and the dashboard is ready to submit.
